

OWNER

Jnanottam

Accountable for the build, the accounts and the client relationship

CLIENT

Dr. R. Dhanush

Malnad produce — coffee, spices and estate goods

SCOPE

Shopify · Razorpay · WhatsApp

Eight stages, each with a gate that must pass before the next begins. Money-handling stages are gated hardest.

00

How we work

Read Section 01 before you create a single account. It is the part that matters most, and it is the part that is hardest to undo if it goes wrong.

WHO DOES WHAT, THROUGHOUT	
MARKED	MEANING
CLAUDE	I do it — code, theme, configuration files, templates, copy, checklists, test scripts.
YOU	You do it, in a browser or on a phone. Anything involving a password, an OTP, KYC, or a live key is always yours.
CLIENT	Dr. Dhanush supplies it — documents, product data, photographs, approvals.
TOGETHER	Screen-share. You drive, I tell you what to click and what to check.

The shape of the build. Eight stages. Each ends with a **gate** — a specific, checkable condition. We do not start the next stage until the gate passes. Stage 3 (payments) has the hardest gate in the project: real money must be shown to move, both ways, and land in the right bank account, before anything else proceeds.

Security — read this first

You said this is sensitive because it touches money. You are right, and the correct response is to give me *less* access, not more.

THE ONE RULE

Never paste a live secret into this chat. Not a password, not an API secret, not an OTP, not a bank detail. Not once, not "just to test".

This is structural, not a matter of trust. Everything typed here becomes part of a conversation transcript that persists, gets summarised, and may be reviewed. A secret that enters a transcript must be treated as compromised and rotated. The way to avoid that is never to put it here in the first place.

Every secret in this project is **generated by you and entered by you, directly into the system that needs it.** I will tell you exactly which field to paste it into. I never need to see it.

WHAT I ACTUALLY NEED FROM YOU

Two things. Both are low-risk, scoped, and revocable in one click.

THE COMPLETE LIST OF ACCESS I NEED				
#	ACCESS	HOW IT IS GRANTED	WHY I NEED IT	REVOKE
1	Shopify Collaborator access	I send you a collaborator request code . You go to Settings → Users → Collaborators, approve it, and tick only the permission boxes listed in Section 02. Never your password.	To build the theme, load products, configure the store and set up the order workflow.	One click, any time. Store keeps running.
2	Google Analytics & Search Console	Add my email as a user with Editor on Analytics and Full on Search Console.	To install tracking correctly and submit the sitemap.	Remove user, any time.

Optional, and only if we hit an integration problem: Razorpay **test-mode** keys (they begin `rzp_test_`). Test mode moves no real money and touches no real bank account. Even these are not needed for a normal Shopify install — the Razorpay app is configured by pasting keys into a field, and you can do that yourself while I watch the screen.

NEVER SEND ME — AND NEVER SEND ANYONE WHO ASKS

- ✗ **Live Razorpay keys** (`rzp_live_...`) or the webhook secret. You generate them, you paste them into Shopify. I never see them.
- ✗ **Any password** — Shopify, Razorpay, Meta, Google, the domain registrar, email, anything.

- ✗ **Any OTP or 2FA code.** There is no legitimate reason for me or anyone else to ask. If something asks you for an OTP that you did not just trigger yourself, stop and tell me.
- ✗ **Bank account credentials, net banking logins, UPI PIN, card numbers or CVV.**
- ✗ **2FA recovery codes or backup codes.**
- ✗ **GST portal, income tax portal or FSSAI portal logins.**
- ✗ **The client's KYC documents.** Those go from the client to Razorpay, and nowhere else. Not through you, not through me.

RULES THAT APPLY FOR THE WHOLE BUILD

- ☐ **Two-factor authentication on every account**, switched on at creation, not before launch. Shopify, Razorpay, Meta, Google, the domain registrar and the store's email. **You**
- ☐ **Every account in the client's name, on the client's card.** You are added as staff or collaborator, never the owner. **You**
- ☐ **Test mode until proven.** No development work happens against live keys. Live keys go in once, at Stage 3, after the test matrix passes. **Both**
- ☐ **Nothing secret in the repository.** Secret scanning on, .gitignore covering every env file, and no keys in commit messages, screenshots or issue text. **Claude**
- ☐ **Least privilege on staff accounts.** Packing staff see orders, not settings, not payouts. **Claude**
- ☐ **Alerts on from day one** — Razorpay email and SMS alerts for every settlement, refund and failed payment, sent to the client, not to you. **You**
- ☐ **My access reduced at handover** to view-only, or removed entirely if the client prefers. **You**
- ☐ **Any secret that is ever exposed gets rotated immediately** — not "watched", rotated. See the incident playbook in Section 11. **Both**

A note on what I am. I can write code, themes, configuration, copy and checklists, and I can tell you exactly what to click. I cannot complete a KYC, receive an OTP, verify a business with Meta, or log into a bank — and I should not be given the means to. Build the project so that remains true, and the worst credential mistake available to us is one that can be undone with a click.

Access matrix

Every system in the project, who owns it, and exactly how much access I get. Nothing here requires you to hand over a password.

SYSTEM BY SYSTEM				
SYSTEM	OWNER	MY ACCESS		GRANTED HOW
Shopify	Client	COLLABORATOR	Themes, Products, Orders, Customers, Apps, Online Store, Reports, Settings (limited)	Collaborator request code → you approve, tick listed boxes only
Razorpay	Client	NONE	Test keys only if a bug needs it	You configure it; I watch the screen and tell you what to set
Domain registrar	Client	NONE		I give you exact DNS records; you paste them
Meta Business / WhatsApp	Client	NONE		Business App lives on the client's phone; I write the content and you set it up
Google Analytics	Client	EDITOR		Add my email as a user
Search Console	Client	FULL USER		Add my email as a user
Store email	Client	NONE		Not needed. Order notifications route to the client.
Git repository	You	WRITE		Already in place
Bank account	Client	NEVER		—

SHOPIFY COLLABORATOR PERMISSIONS — TICK EXACTLY THESE

- ☐ **Products** — to load and structure the catalogue
- ☐ **Orders** — to build and test the dispatch workflow
- ☐ **Customers** — to configure accounts and notifications
- ☐ **Online Store** (themes, pages, navigation, blog, preferences) — the storefront itself
- ☐ **Apps** — to install Razorpay and any required app
- ☐ **Reports & Analytics** — to verify figures reconcile
- ☐ **Store settings** — taxes, shipping zones, policies, locations, notifications

Leave unticked: **MANAGE PLAN** **MANAGE USERS** **PAYOUTS / FINANCES**

GIFT CARDS — I do not need any of them, and none of them are required to build this store.

Why collaborator and not staff. A Shopify collaborator account is designed for exactly this: it is free, it does not consume a staff seat, permissions are granular, it never involves sharing a password, and the client can revoke it in one click without disturbing anything. Ask for staff access only if the client's plan does not support collaborators.

03

The eight stages

Each stage has an owner, a checklist and a gate. The gate is a condition, not an opinion — it either passes or it does not.

Stage 0 — Foundations and access

Days 1–3

- ☐ Client creates the **Shopify account** in their own name, on their own card, and switches on two-factor. **Client**
- ☐ Client buys the **domain** and switches on two-factor and registrar lock. **Client**
- ☐ Client opens the **Razorpay account** and files KYC with PAN, GSTIN, FSSAI licence, business registration and cancelled cheque. Filed on day one because it runs on Razorpay's clock, not ours. **Client**
- ☐ Client registers the **WhatsApp Business number** and installs the Business App. **Client**
- ☐ You approve my **collaborator request** with the permissions in Section 02. **You**
- ☐ You add me to **Analytics and Search Console**. **You**
- ☐ I set up the **repository** — theme source, product data templates, configuration, secret scanning, .gitignore. **Claude**
- ☐ I send the **catalogue data template** to be filled. This is the longest-lead item in the project — it goes out on day one. **Claude**

GATE I can open the Shopify admin as a collaborator · Razorpay KYC is submitted with a reference number · the catalogue template is with the client.

Stage 1 — Catalogue and compliance data

Days 2–10, in parallel

- ☐ Client fills the catalogue template: every product, every pack size, price, weight, stock, and all seven Legal Metrology declarations plus HSN code. **Client**
- ☐ I define **Shopify metafields** for the declarations so each one is a real, structured field rather than text buried in a description. **Claude**
- ☐ I build the **import file** and load products as drafts. **Claude**
- ☐ I add a **publication check**: a product with any declaration missing stays a draft and cannot go live. **Claude**
- ☐ I set the **GST rate and HSN per product** — 5% for roasted or ground coffee and most whole spices, 12% where a blend qualifies. The client's accountant confirms each one before we publish. **Claude Client**
- ☐ Photographs collected, cropped and compressed. **Client Claude**

GATE All products loaded as drafts · zero products missing a declaration · GST rate per product signed off by the client's accountant in writing.

Stage 2 — Storefront

Week 2

- ☐ Theme installed, brand colours, typography and logo applied. **Claude**
- ☐ Homepage, collection pages, product page, Our Estate, Contact built. **Claude**
- ☐ **Declarations block** on every product page, rendered from the metafields, not typed by hand. **Claude**
- ☐ Pack size and grind selectors working, with per-variant price and stock. **Claude**
- ☐ Policy pages drafted — shipping, returns, refunds, privacy, terms. **Claude**
- ☐ Mobile checked on a real phone on mobile data, not just a desktop browser resized. **Together**
- ☐ Preview link sent for approval; two rounds of revisions included. **Client**

GATE Client approves the preview link in writing · every product page shows a complete declarations block · the site is usable on a phone on 4G.

Stage 3 — Payments

HIGHEST RISK

Week 3

- ☐ Razorpay KYC confirmed **approved**. Nothing in this stage starts before that. **Client**
- ☐ Razorpay app installed in Shopify. **Claude**
- ☐ **Test mode keys** entered and the full test matrix in Section 04 run end to end. **Together**
- ☐ Cash on Delivery confirmed **off**. **Claude**
- ☐ Settlement bank account set and verified by the client on the Razorpay dashboard.
Client
- ☐ **Live keys generated by the client and pasted by the client** into the Shopify Razorpay app. Screen-share so I can confirm the right field, without the value entering this chat.
Client
- ☐ Live rupee-value test matrix run again, including a real refund. **Together**
- ☐ Magic Checkout enabled and verified as the default checkout path. **Claude**
- ☐ Razorpay alerts switched on for settlements, refunds and failures, routed to the client.
Client

GATE Every row of the Section 04 matrix passes in live mode · a real refund completes · **A SETTLEMENT IS CONFIRMED LANDED IN THE CLIENT'S BANK STATEMENT**. Until money is seen arriving in the bank, this stage is not done.

Stage 4 — Orders, dispatch and the owner dashboard

Week 3

- ☐ Order statuses and tags configured for the client's own delivery workflow. [Claude](#)
- ☐ **Packing slip template** built — items, pack sizes, address, phone, order number. [Claude](#)
- ☐ Dispatch action with a **tracking or docket number field** that triggers the customer notification. [Claude](#)
- ☐ Customer emails and messages written for confirmed, dispatched and delivered. [Claude](#)
- ☐ Refund and cancellation process documented, with who is allowed to approve one. [Claude](#)
- ☐ Staff accounts created with least-privilege roles — packing staff see orders, not settings or payouts. [Client](#)
- ☐ **Offline sales recorded as real Shopify orders**, not as a separate note or spreadsheet. This is the decision that makes every other number correct: stock decrements, a GST invoice is raised, the customer record is created, and the website can never sell something already sold at the estate gate. [Claude](#)
- ☐ A documented entry flow for offline sales using Shopify's built-in draft orders — available on the Basic plan and, importantly, **on the Shopify phone app**, so a sale at the estate gate is recorded where it happens rather than remembered until evening. Pick products, quantity, mark how it was paid, done. [Claude](#)
- ☐ **Order source tracking** — every order identified as website, WhatsApp or offline, so the channel split is real data rather than a guess. This works on the Basic plan with no app and no automation: Shopify records order attribution natively and shows it in each order's conversion summary, offline orders are created in admin and tagged at that moment, and WhatsApp links carry `utm_source=whatsapp`. [Claude](#)
- ☐ **UTM parameters on every WhatsApp link are mandatory, not optional.** WhatsApp strips the referrer header from links it passes on, so without them every WhatsApp order arrives looking like direct traffic and the channel split is silently wrong. Applies to the community join link, catalogue links, broadcast links and the parcel insert QR code. [Claude](#)
- ☐ **Owner dashboard built** to the approved mockup — orders and money for today, week and month against the previous month; settled versus in-flight money; awaiting dispatch; best sellers; low stock; new versus repeat customers; channel split. [Claude](#)
- ☐ **Monthly GST and HSN summary** exportable from the dashboard for the client's accountant. [Claude](#)
- ☐ **How orders reach the dashboard.** Website and WhatsApp orders arrive on their own: the dashboard reads the store through a custom app's Admin API token, created at Settings → Apps → Develop apps. There is no sync step and nothing for the client to press. This is free and available on the Basic plan — no upgrade, no paid app. Note only that Shopify retired the older private-app route on 1 January 2026, so older guides point at a menu that no longer exists. [Claude](#)
- ☐ **The dashboard's API token is read-only** — `read_orders`, `read_products`, `read_customers` and nothing else. No write scope, no payout scope. Even if the token

leaked it could not alter an order, change a price or move money. Offline order entry deliberately does not use it: that runs through Shopify's own order creation, so it inherits Shopify's stock, tax and invoice handling rather than reimplementing them.

Claude

GATE A dry-run order goes from paid to packed to dispatched to delivered with every message arriving on time · an offline sale entered by the client reduces stock, raises a GST invoice and appears in the dashboard totals · the dashboard figures reconcile against Shopify's own reports for the same period.

Stage 5 — WhatsApp community

Weeks 3–4

- ☐ Business profile completed — name, logo, address, hours, website. **Client**
- ☐ Catalogue built inside WhatsApp from the same product data. **Claude Client**
- ☐ **Community created** with an announcement group and topic groups for Harvest Updates, Offers, and Recipes & Brewing. **Together**
- ☐ Group rules, descriptions and welcome message written. **Claude**
- ☐ Join link and QR code produced; placed on the website, the order confirmation, and a printed parcel insert. **Claude**
- ☐ Broadcast lists and a first-month message calendar set up. **Claude**
- ☐ **Opt-in consent captured and recorded** at checkout and on the join link. Meta bans numbers that message people who did not consent. **Claude**
- ☐ Staff trained to run a broadcast themselves. **Together**

GATE The join link works from a phone that has never seen it · the catalogue is browsable in chat · a test broadcast reaches a test contact.

Stage 6 — Hardening and pre-launch audit

Week 4

- ☐ **Security audit** — two-factor confirmed on every account, staff permissions reviewed, installed apps audited and anything unused removed. **Claude You**
- ☐ **Compliance audit** — every published listing re-checked for all seven declarations and the FSSAI number. **Claude**
- ☐ **Tax audit** — GST rate and HSN per product, invoice format, and invoice numbering confirmed sequential and unbroken. **Client's accountant**
- ☐ Policy pages reviewed by the client's advisor. **Client**
- ☐ SEO — titles, descriptions, product structured data, sitemap submitted. **Claude**
- ☐ Analytics verified recording a real transaction. **Claude**
- ☐ **Full test matrix re-run on the live store** after every configuration change. **Together**
- ☐ Runbook written — how to add a product, refund an order, rotate a key, and what to do when something breaks. **Claude**

GATE Every audit signed off · the test matrix passes on the live store · the runbook is written and handed over.

Stage 7 — Launch and handover

Week 4

- ☐ DNS cut over to the live domain; password protection removed. **Client Claude**
- ☐ First real order watched end to end, by both of us. **Together**
- ☐ Ninety-minute training session, recorded. **Together**
- ☐ Runbook, logins list and account inventory handed to the client. **You**
- ☐ My access reduced to view-only, or removed. **You**
- ☐ Thirty days of defect support begins. **You**

GATE A real customer order completes and the money reaches the bank · the client can add a product and issue a refund unaided.

Payment test matrix

Run every row in **test mode** first. Then run every row again in **live mode** with real rupees. A row passes only when the result is confirmed in both Shopify and Razorpay — one system agreeing with itself proves nothing.

RUN TWICE — ONCE IN TEST MODE, ONCE LIVE. EVERY ROW MUST PASS.

#	TEST	HOW	EXPECTED RESULT	CONFIRM IN
1	UPI success	Pay ₹1 by GPay or PhonePe	Order created, marked paid, stock reduced by one	Shopify + Razorpay
2	UPI abandoned	Start the payment, then cancel in the UPI app	No order created; abandoned checkout recorded; stock released	Shopify
3	Card success	Pay ₹1 by debit or credit card	Order created and marked paid	Shopify + Razorpay
4	Card 3-D Secure failure	Enter a wrong OTP deliberately	Payment fails, no order created , customer sees a clear message	Shopify + Razorpay
5	Net banking	Pay ₹1 by net banking	Order created and marked paid	Shopify + Razorpay
6	Wallet	Pay ₹1 by a wallet	Order created and marked paid	Shopify + Razorpay
7	Duplicate notification	Replay the payment webhook from the Razorpay dashboard	Exactly one order. No duplicate, no double-charge recorded	Shopify
8	Full refund	Refund the order from Shopify	Refund appears in Razorpay; customer's money returns in 5–7 working days	Shopify + Razorpay
9	Partial refund	Refund part of a multi-item order	Correct partial amount, order shows partially refunded	Shopify + Razorpay
10	Settlement lands	Wait the settlement cycle (T+2, longer for the first few)	Money appears in the client's bank account , matching the Razorpay settlement report	Bank statement
11	Magic Checkout path	Place an order through Magic Checkout	Order completes; Shopify's 2% third-party fee is not charged on it	Shopify billing
12	GST invoice	Open the invoice for a completed order	Correct GST rate and HSN, correct total, sequential invoice number with no gap	Shopify
13	Last unit race	Set stock to 1, attempt two checkouts at once	Exactly one succeeds; the other is told it is sold out. Stock never goes negative	Shopify

#	TEST	HOW	EXPECTED RESULT	CONFIRM IN
14	Cash on Delivery is off	Attempt checkout looking for a COD option	No COD option is offered anywhere	Shopify
15	Delivery charge by pin code	Check out to a near and a far pin code	Correct charge each time; free-delivery threshold applies correctly	Shopify
16	Notifications fire	Complete one order fully	Confirmation and dispatch messages reach the customer at the right moments	Test inbox and phone

STOP CONDITIONS

If **any** of rows 7, 10, 12 or 13 fails, stop the launch. Those four are the ones where a failure quietly costs the client money or creates a tax problem: a duplicate order, money that never lands, a broken invoice series, or stock sold twice. A failure there is not a snag to fix later.

Record each run in the repository with the date, who ran it, and the order and payment reference numbers. If a figure is ever questioned, that record is the answer.

Incident playbook

What to do when something goes wrong with money. Decided now, calmly, rather than at 10pm during a festival sale.

IF THIS HAPPENS → DO THIS, IN THIS ORDER		
SITUATION	FIRST ACTION	THEN
Customer says they paid but has no order	Find the payment in Razorpay by amount, time and phone number. Confirm it actually succeeded.	If it succeeded: create the order manually, mark it paid against that payment reference, apologise, dispatch. Then find out why the notification did not arrive, and fix that.
Customer charged twice	Confirm two distinct successful payments in Razorpay for the same cart.	Refund one immediately, in full, before arguing about cause. Tell the customer it is done and when the money returns. Then investigate.
Settlement did not arrive	Check the Razorpay settlement report and the settlement status — it may be on hold pending a KYC or bank detail mismatch.	Client contacts Razorpay support with the settlement reference. Do not change bank details to "fix" it without confirming why it is held.
Refund fails	Check the refund status in Razorpay and whether the merchant balance covers it.	Top up if required and retry. If the card is closed, Razorpay will advise the bank route. Keep the customer informed in writing.
A key or password was exposed	Rotate it immediately. Do not watch and wait. Regenerate in Razorpay, paste the new value into Shopify, verify one live transaction.	Review the transaction log for the exposure window. Change the account password and check active sessions and connected apps.
Suspected account compromise	Change the password, sign out all sessions, check staff accounts and connected apps for anything unrecognised.	Rotate every key. Check that the settlement bank account has not been altered — this is the first thing an attacker changes.
Store is down	Check Shopify's status page before anything else. If Shopify is up, check DNS and recent theme changes.	Roll back the last theme change. Shopify keeps previous theme versions for exactly this.
Someone asks the client for an OTP	Do not share it. End the call.	Nobody legitimate asks for an OTP — not Razorpay, not Shopify, not you, not me. Tell the client this during training, in these words.

After launch — the weekly check

Ten minutes a week. Worth putting in the client's calendar during training.

- ☐ **Settlements reconcile** — Razorpay settlement total for the week matches what landed in the bank.
- ☐ **Failed payments** — a sudden rise usually means a broken checkout, not unlucky customers.
- ☐ **Orders stuck unpaid or unfulfilled** for more than 48 hours.
- ☐ **Refunds issued** — each one recognised and expected.
- ☐ **Stock counts** against what is physically on the shelf.
- ☐ **Invoice series** — still sequential, no gaps.
- ☐ **Staff and collaborator list** — nobody with access who should not have it.
- ☐ **Shopify billing** — the 2% third-party fee still not being charged on Magic Checkout orders.

What I need from you, right now

In order. Items 1 to 4 are yours and the client's and do not involve me. Item 5 is the only thing you grant me to begin.

1. **Client creates the Shopify account** in their own name, on their own card, with two-factor switched on. Fourteen-day trial is fine to start.
2. **Client opens Razorpay and files KYC** — PAN, GSTIN, FSSAI licence, business registration, cancelled cheque. **Do this first, today.** It runs on Razorpay's clock and it is the single most common cause of a delayed launch.
3. **Client buys the domain**, with two-factor and registrar lock on.
4. **Client fills the catalogue template** I am sending with this. Thirty products, every pack size, and all seven declarations. This is the longest-lead item in the project and nothing in Stage 2 can finish without it.
5. **You approve my Shopify collaborator request** with the permissions in Section 02, and add me to Analytics and Search Console.

AND TO BE COMPLETELY CLEAR

That is the entire list. **No passwords, no OTPs, no live keys, no bank details, no KYC documents** come to me at any point in this project. If at any stage something appears to ask you for one of those in my name, it is not me — stop and check.

What I do the moment Stage 0 clears. Repository scaffolded with the theme source and secret scanning · product metafield definitions written · the import file built from the client's catalogue data · storefront build begun · policy pages, notification copy and WhatsApp community content drafted. None of that needs a single credential beyond collaborator access.

ABOUT THIS DOCUMENT

Internal working document for the Malnad Store build. It is the operational companion to quotation JTACS/QTN/2026-27/023 and does not change its commercial terms. Sections 01, 02, 04 and 05 are the security-critical parts and should be re-read before each money-handling stage. Revision 1.0, 15 September 2026 — update this document rather than working around it when the plan changes.
